

MTE 544 - LAB 1

Questions/Doubts we have:

1. In part 4 we define the motion as a straight line but noticed the function has acc in the name. Does that mean we need an accelerating straight line? Additionally does our spiral need to get larger or smaller?
2. For calculating the yaw in part 5 we got the formula from online (robot stack exchange) but couldn't find a way to calculate it in the lectures? Is there a more standard way or an expected way this can be done?
3. Our laser content spiral file after the simulation has lots of Infinity values with a few rows of actual values, this was confusing to us. Does each column represent one laser Ray?
